CONN WELD

CONN-WELD WEEKLY MAINTENANCE SCHEDULE

needed. STEP 2. Breather: Clear away any material buildup that could potentially clog breather. STEP 3. Bolts: Inspect for loose bolts DRIVE MECHANICALS STEP 1. V-Belt: Inspect for loose bolts STEP 2. Bolts: Inspect for loose bolts STEP 3. Cardan Shaft: Grease drive shaft and pillow block bearings STEP 3. Cardan Shaft: Grease drive shaft and pillow block bearings STEP 1. MOTOR STEP 1. Motor Follow motor manufacturer's maintenance procedures BODY Step 1. STEP 2. Side Plates: Inspect for loose bolts, wear, or cracking STEP 3. Deck support: Inspect for loose bolts, wear, or cracking STEP 4. Screen Body: Check for 3" clearances between vibrating screen body and stationary components (i.e., chutes, beams, etc.). STEP 5. Side Plates: Inspect for loose bolts, wear, or cracking STEP 7. Screen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 1. Screen hold down system hardware for damage, wear, and clear material build up (i.e., lams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for even compression during operation STEP 1.	STEP 1.	Check oil: Follow standard procedures by pulling indicated oil check plug. Add oil if
STEP 3. Bolts: Inspect for loose bolts DRIVE MECHANICALS STEP 1. V-Belt: Inspect for loose bolts STEP 3. Cardan Shaft: Grease drive shaft and pillow block bearings NOTE: NUMBER 3 IS FOR CARDAN SHAFT DRIVEN G-MASTER MECHANISMS ONLY MOTOR Step 1. Motor Follow motor manufacturer's maintenance procedures BODY Screen Body: Check for 3" clearances between vibrating screen body and stationary components (i.e., chutes, beams, etc.). STEP 1. Screen Body: Check for 3" clearances between vibrating screen body and stationary components (i.e., chutes, beams, etc.). STEP 2. Side Plates: Inspect for loose bolts, wear, or cracking STEP 3. Deck support: Inspect for loose hardware, excessive wear, damage FRAME Streen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 2. Inspect snoled down system hardware for damage, wear, and clear material build up (i.e., dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION Steel Coil Springs: Inspect for wear, damage, or breakage Loose hardware Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage </td <td>5111 1.</td> <td></td>	5111 1.	
DRIVE MECHANICALS STEP 1. V-Belt: Inspect for loose bolts STEP 2. Bolts: Inspect for loose bolts STEP 3. Cardan Shaft: Grease drive shaft and pillow block bearings NOTE: NUMBER 3 IS FOR CARDAN SHAFT DRIVEN G-MASTER MECHANISMS ONLY MOTOR STEP 1. Motor Follow motor manufacturer's maintenance procedures BODY STEP 1. Screen Body: Check for 3" clearances between vibrating screen body and stationary components [i.e., chutes, beams, etc.]. STEP 2. Side Plates: Inspect for loose bolts, wear, or cracking STEP 3. Deck support: Inspect for loose hardware, excessive wear, damage FRAME Streen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 2. Inspect screen hold downs, clamping bars, etc) STEP 3. Check for loose hardware SUSPENSION Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware Step 2. STEP 1. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware Loose hardware<	STEP 2.	Breather: Clear away any material buildup that could potentially clog breather.
STEP 1. V-Belt: Inspect for loose holts STEP 2. Bolts: Inspect for loose bolts STEP 3. Cardan Shaft: Grease drive shaft and pillow block bearings NOTE: NUMBER 3 IS FOR CARDAN SHAFT DRIVEN G-MASTER MECHANISMS ONLY MOTOR STEP 1. Motor Follow motor manufacturer's maintenance procedures BODY STEP 1. STEP 1. Screen Body: Check for 3" clearances between vibrating screen body and stationary components [i.e., chutes, beams, etc.]. STEP 2. Side Plates: Inspect for loose bolts, wear, or cracking STEP 3. Deck support: Inspect for loose hardware, excessive wear, damage FRAME Screen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 2. Inspect screen hold down system hardware for damage, wear, and clear material build up (i.e., dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, ch	STEP 3.	Bolts: Inspect for loose bolts
STEP 2. Bolts: Inspect for loose bolts STEP 3. Cardan Shaft: Grease drive shaft and pillow block bearings NOTE: NUMBER 3 IS FOR CARDAN SHAFT DRIVEN G-MASTER MECHANISMS ONLY MOTOR STEP 1. Motor Follow motor manufacturer's maintenance procedures BODY STEP 1. Screen Body: Check for 3" clearances between vibrating screen body and stationary components [i.e., chutes, beams, etc.]. STEP 2. Side Plates: Inspect for loose bolts, wear, or cracking STEP 3. Deck support: Inspect for loose hardware, excessive wear, damage FRAME Screen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 2. Inspect screen hold down system hardware for damage, wear, and clear material build up (i.e., dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage TEP 2. Rubber Buffers: <td>DRIVE</td> <td>MECHANICALS</td>	DRIVE	MECHANICALS
STEP 3. Cardan Shaft: Grease drive shaft and pillow block bearings NOTE: NUMBER 3 IS FOR CARDAN SHAFT DRIVEN G-MASTER MECHANISMS ONLY MOTOR STEP 1. Motor Follow motor manufacturer's maintenance procedures BODY Strep 1. STEP 1. Screen Body: Check for 3" clearances between vibrating screen body and stationary components (i.e., chutes, beams, etc.). STEP 2. Side Plates: Inspect for loose bolts, wear, or cracking STEP 3. Deck support: Inspect for loose hardware, excessive wear, damage FRAME Strep 1. STEP 2. Inspect screen hold down system hardware for damage, wear, even material distribution (during operation), and clear material build up STEP 3. Check for loose hardware SUSPENSION Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware Loose hardware and fittings Inspect for loose hardware and fittings Inspect for loose hardware and fittings	STEP 1.	
NOTE: NUMBER 3 IS FOR CARDAN SHAFT DRIVEN G-MASTER MECHANISMS ONLY MOTOR STEP 1. Motor Follow motor manufacturer's maintenance procedures BODY STEP 1. Screen Body: Check for 3" clearances between vibrating screen body and stationary components (i.e., chutes, beams, etc.). STEP 2. Side Plates: Inspect for loose bolts, wear, or cracking STEP 3. Deck support: Inspect for loose hardware, excessive wear, damage FRAME STEP 1. Screen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 2. Inspect screen hold down system hardware for damage, wear, and clear material build up (i.e., dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION STEP 1. Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for voltipping during operation	STEP 2.	Bolts: Inspect for loose bolts
MOTOR STEP 1. Motor Follow motor manufacturer's maintenance procedures BODY STEP 1. Screen Body: Check for 3" clearances between vibrating screen body and stationary components (i.e., chutes, beams, etc.). STEP 2. Side Plates: Inspect for loose bolts, wear, or cracking STEP 3. Deck support: Inspect for loose hardware, excessive wear, damage FRAME Screen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 2. Inspect screen hold down system hardware for damage, wear, and clear material build up (i.e., dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 2. STEP 2. Rubber Buffers: Inspect for loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation Inspect for whipping durin	STEP 3.	Cardan Shaft: Grease drive shaft and pillow block bearings
STEP 1. Motor Follow motor manufacturer's maintenance procedures BODY STEP 1. Screen Body: Check for 3" clearances between vibrating screen body and stationary components (i.e., chutes, beams, etc.). STEP 2. Side Plates: Inspect for loose bolts, wear, or cracking STEP 3. Deck support: Inspect for loose hardware, excessive wear, damage FRAME Strep 1. Screen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 2. Inspect screen hold down system hardware for damage, wear, and clear material build up (i.e., dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage TEP 2. Rubber Buffers: Inspect for loose hardware and fittings TSTEP 3. Cable suspension: Check for loose hardware and fittings		
BODY STEP 1. Screen Body: Check for 3" clearances between vibrating screen body and stationary components (i.e., chutes, beams, etc.). STEP 2. Side Plates: Inspect for loose bolts, wear, or cracking STEP 3. Deck support: Inspect for loose hardware, excessive wear, damage FRAME STEP 1. Screen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 2. Inspect screen hold down system hardware for damage, wear, and clear material build up (i.e., dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 2. Rubber Buffers: Inspect for loose hardware and fittings Inspect for whipping during operation		
STEP 1. Screen Body: Check for 3" clearances between vibrating screen body and stationary components Side, chutes, beams, etc.). STEP 2. Side Plates: Inspect for loose bolts, wear, or cracking STEP 3. Deck support: Inspect for loose hardware, excessive wear, damage FRAME STEP 1. Screen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 2. Inspect screen hold down system hardware for damage, wear, and clear material build up (i.e., lams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Cose hardware Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings	STEP 1.	Motor Follow motor manufacturer's maintenance procedures
(i.e., chutes, beams, etc.). STEP 2. Side Plates: Inspect for loose bolts, wear, or cracking STEP 3. Deck support: Inspect for loose hardware, excessive wear, damage FRAME STEP 1. Screen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 2. Inspect screen hold down system hardware for damage, wear, and clear material build up (i.e., dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION STEP 1. Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation	BODY	
STEP 2. Side Plates: Inspect for loose bolts, wear, or cracking STEP 3. Deck support: Inspect for loose hardware, excessive wear, damage FRAME Streen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 2. Inspect screen hold down system hardware for damage, wear, and clear material build up (i.e., dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 2. STEP 3. Cable suspension: Check for loose hardware and fittings	STEP 1.	Screen Body: Check for 3" clearances between vibrating screen body and stationary components
STEP 3. Deck support: Inspect for loose hardware, excessive wear, damage FRAME STEP 1. Screen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 2. Inspect screen hold down system hardware for damage, wear, and clear material build up (i.e., dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings	(i.e., chute	
FRAME STEP 1. Screen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 2. Inspect screen hold down system hardware for damage, wear, and clear material build up (i.e., dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION STEP 1. Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 2. STEP 3. Cable suspension: Check for loose hardware and fittings	STEP 2.	
STEP 1. Screen Surface: Inspect screen surface for damage, wear, even material distribution (during operation), and clear material build up STEP 2. Inspect screen hold down system hardware for damage, wear, and clear material build up (i.e., dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation	STEP 3.	Deck support: Inspect for loose hardware, excessive wear, damage
operation), and clear material build up STEP 2. Inspect screen hold down system hardware for damage, wear, and clear material build up (i.e., dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation Inspect for whipping during operation	FRAME	
STEP 2. Inspect screen hold down system hardware for damage, wear, and clear material build up (i.e., dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation Inspect for wear, cracking, peeling, chipping, and damage	STEP 1.	
dams, locking strips, center hold-downs, clamping bars, etc) STEP 3. Check for loose panels or loose hardware SUSPENSION STEP 1. Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation		
STEP 3. Check for loose panels or loose hardware SUSPENSION STEP 1. Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation		
SUSPENSION STEP 1. Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation		
STEP 1. Steel Coil Springs: Inspect for wear, damage, or breakage Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation	STEP 3.	Check for loose panels or loose hardware
Check for even compression during operation Check for even compression during operation Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation		
Inspect snubber spring, spring mounts, urethane retainers for wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation	STEP 1.	
wear, damage, or breakage Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation		
Loose hardware STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation		
STEP 2. Rubber Buffers: Inspect for even wear, cracking, peeling, chipping, and damage Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation		
Loose hardware STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation		
STEP 3. Cable suspension: Check for loose hardware and fittings Inspect for whipping during operation	STEP 2.	
Inspect for whipping during operation		
		Cable suspension: Check for loose hardware and fittings
